AB A pasteurization or sterilization process reduces fouling of a food or beverage composition containing protein during the heat treatment. An antifouling agent for addition to the food or beverage composition is selected from hydroxypropylcellulose (HPC) with a hydroxypropyl molar substitution >3.0 and a weight average mol. weight (Mw) as measured by SEC of >350,000 Dalton, methylhydroxypropylcellulose (MHPC) with a methoxyl content >17% and a hydroxypropyl content >3%, methylcellulose (MC) with a methoxyl content >17% and a viscosity in water at ambient temps. and a concentration of 2% of >1,000 cps, or mixts. thereof. This food or beverage composition is then heated in a first heat exchanger at 50-100° for about 2 s to 30 min for pasteurization or

it is further heated to sterilization temps. before being packaged out or further processed. The improvement of this process is that the heat exchangers are fouled $\geq 10\%$ by weight less (or the run-time is increased $\geq 10\%$) as compared to when heat-treating a similar food or beverage composition without the antifouling agent.

AB An aqueous fabric softening composition having good high temperature stability comprises a cationic fabric softening compound and a water-soluble polysaccharide comprising hydrophobic groups selected from aryl, alkyl, alkenyl, aralkyl each having at least 14 carbon atoms and cationic quaternary ammonium salt groups such that the cationic degree of substitution is from 0.01 to 0.2, the polysaccharide having a mol. weight in the range from 100,000 to 700,000. Preferably, the hydrophobically modified water-soluble polysaccharide is quaternary ammonium salt-containing C16-C18-alkyl ether of 2-hydroxyethyl cellulose, and the cationic fabric softener is N,N-di(hydrogenated tallowoxyloxyethyl)-N-hydroxyethyl-N-methylammonium Me sulfate.

AB A water-soluble, associative CM-cellulose (CMC) exhibits unique and highly desirable rheol. and performance properties in a wide variety end-use systems. The end-use systems include personal care, household care, paint, building material and construction, pharmaceutical, medical care, oilfield, mineral processing, paper making and paper coating, and food. A process for making the CMC comprises: (a) reacting in a slurry process, a source of cellulose, and .apprx.40-80% of the stoichiometric amount of NaOH for a sufficient time and at a sufficient temperature to form an alkali cellulose, and (b) adding to the alkali cellulose an amount of NaOH to bring the total amount of NaOH to about the stoichiometric level, and (c) immediately after step b, adding monochloroacetic acid to step b in a sufficient amount and reacting the slurry at a temperature and time sufficient to effect etherification in order to form the CMC product.

AB Microfibrillar cellulose is derivatized to contain a substituent that provides cationic charge. The cationic microfibrillar cellulose is prepared by derivatizing a microfibrillar cellulose to obtain a derivatized microfibrillar cellulose, microfibrillizing a derivatized non-microfibrillar cellulose to produce a derivatized microfibrillar cellulose, or

microfibrillizing and derivatizing a non-microfibrillar cellulose substantially simultaneously. The derivatized microfibrillar cellulose is useful as a rheol. modifier and in coatings, paper, emulsions, dispersions, paper compns., comestible compns., non-comestible spreadable compns., and foams.

AB The invention is directed to the following. A method for producing derivatized microfibrillar polysaccharide, including but not limited to cellulose, derivatized by steric and/or electrostatic forces, where the electrostatic forces are provided by anionic charge or by a combination of both anionic and cationic charge, by stabilizing and/or microfibrillating a polysaccharide starting material. A method of modifying the rheol. properties of a composition of matter using derivatized microfibrillar polysaccharide. Method of improving coatings, paper manufacture, and the stability of emulsions, dispersions, and foams using a derivatized microfibrillar polysaccharide. Compns. that include derivatized microfibrillar polysaccharide, e.g., CM cellulose, including paper compns., comestible compns., non-comestible spreadable compns. (cosmetics), and emulsions, dispersion, and foams.

AB Thickeners comprise a combination of associative thickeners, wherein at least one associative thickener is a hydrophobically modified cellulose derivative or a hydrophobically modified guar derivative and is present in the combination of associative thickeners in a relative amount of at least 70% by weight or in a relative amount of not more than 30% by weight, based on the weight of the combination of associative thickeners. A thickener composition contained hydrophobically modified hydroxyethyl cellulose and hydrophobically modified polyethylene glycol.

AB The associative thickener is not a polyurethane thickener and is selected so that its concentration required by the specific application method is below the critical concentration, defined as the thickener concentration at which the coils of the thickener polymer start to overlap or entangle calculated according to the Mark-Houwink equation. Cetyl-modified hydroxyethyl cellulose thickener with viscosity average mol. weight 60,000 and at concentration 1.07% in a styrene-acrylic anticorrosion primer was sprayed onto a substrate to give a smooth film having good silt spray resistance and no blistering.

WO 1999-US11728 W 19990525

AB A coating composition comprises a water soluble polysaccharide composition comprising at least one hydrophobic group selected from aryl, alkyl, alkenyl, aralkyl and mixts. thereof and at least one quaternary ammonium salt group, both connected to a polysaccharide backbone by covalent bonds. The coating composition also comprises a synthetic thickener such as hydrophobically modified polyethylene oxide, associative acrylic polymer, and hydrophobically modified ethoxylated urethane. The water-soluble polysaccharides are prepared by (1) preparing slurry of the associative thickener such as hydroxyethyl cellulose in presence of water and caustic, (2) reacting with glycidyl trimethylammonium chloride at 45° for about 4 h under a nitrogen blanket, and (3) cooling, neutralizing, precipitating, filtering, and drying. This coating is used for improving the leveling of waterborne paints.

AB In a process for preparing a latex system that has a tendency to flocculate because of grafting, the improvement comprises aqueous emulsion polymerizing of ≥ 1 unsatd. monomer (e.g., acrylic acid, methacrylic acid, Bu acrylate, Me methacrylate, acrylic esters, styrene, vinyl ethers, vinyl, vinylidene halides, N-vinyl pyrrolidone, ethylene, C3 or greater alpha-olefins, allyl amines, allyl esters of saturated monocarboxylic acids and amides thereof, propylene, 1-butene, 1-pentene, 1-hexene, 1-decene, allyl amines, allyl acetate, allyl propionate, allyl lactate and derivs.) in the presence of a water-soluble protective colloid. The protective colloid has a weight-average mol. weight <75,000, and is selected from CM-cellulose and derivs. having a carboxyl degree of substitution lower limit of about 0.7, hydroxyethylcellulose, Et hydroxyethylcellulose, methylcellulose, Me hydroxypropylcellulose, hydroxypropylcellulose, poly(acrylic acid) and alkali metal salts thereof, ethoxylated starch derivs., sodium and other alkali metal polyacrylates, water soluble starch glue, gelatin, water soluble alginates, casein, agar, natural and synthetic gums, partially and fully hydrolyzed poly(vinyl alc.), polyacrylamide, poly(vinyl pyrrolidone), poly(Me vinyl ether-maleic anhydride), gelatin, and casein. The latex has improved mech. and shear stability. This latex provides coating manufacturers the flexibility of either eliminating surfactants altogether from coating or to use small amts. thereof.

			WO 1995-US12757	W 19951103
AB	Polymer latexes having improved mech. and shear stability are prepared by emulsion polymerization of at least one ethylenically unsatd. monomer having up to 23 carbons in the presence of a surfactant, a protective colloid with a mol. weight of less than 75,000 (in an amount of .apprx.0.05-5.0% based on the monomer content), and at least one water-soluble free-radical polymerization initiator (in an amount of .apprx.0.01-1.5% based on the monomer content.). The protective colloids are selected from the group consisting of cellulose ethers (CMC, hydroxyethyl cellulose, Et hydroxyethyl cellulose, Me cellulose, Me hydroxypropyl cellulose, hydroxypropyl cellulose) or their derivs., poly(acrylic acid) and their alkali metal salts, ethoxylated starch derivs., water-soluble starch, gelatin, alginates, casein, agar, natural and synthetic gums, partially or fully hydrolyzed poly(vinyl alc.), polyacrylamide, poly(vinyl pyrrolidone), or maleic anhydride-Me vinyl ether copolymer. This latex provides coating manufacturers the flexibility of either eliminating surfactants altogether from coating or to use small amts. thereof. Thus, 16.6 g CM-cellulose (mol. weight 7,000-11,000, substitution degree .apprx. 1.2) together with 1.6 g NaHCO ₃ were dissolved in 461 g demineralized water, the temperature was raised to 85°, 1.5 g K ₂ S ₂ O ₈ initiator in 50 g water was added, followed by addition of the monomer mixture containing 248.6 g Bu acrylate, 248.6 g Me methacrylate, and 2.8 g methacrylic acid. After several hours a fine dispersion of the polymeric latex was obtained. Due to the small size of the obtained latex particles, they may be employed in latex paint compns. with high pigment content without the need to add surfactants to the paint.

AB The title paint compns. comprise a clay-containing pigment system, a latex binder, a polysaccharide (e.g., hydroxyethyl cellulose) thickener, and 0.005-2%, based upon the weight of the pigment, of a blocking agent [e.g., poly(ethylene glycol)] which serves to prevent more than 20% of the polysaccharide thickener from being adsorbed onto the clay pigment surface, whereby the paint composition exhibits improved appearance and application performance.

 AB The associative behavior of hydrophobically modified hydroxyethyl cellulose (HMHEC) in polymer dispersions has been determined as a function of the composition of both the associative thickener (AT) and the latex. The impact of latex composition and HMHEC composition on the adsorption

characteristics and rheol. properties of the latex-thickener system were demonstrated. Adsorption of HMHECs onto an acrylic emulsion strongly depends on the hydrophobe type and degree of substitution, as well as on the mol. weight of the associative thickener. The degree of latex adsorption is influenced dramatically by the stabilization system utilized, that is choice and level of surfactant and carboxylic acid content, in addition to the composition of the monomer mix. Rheol. measurements demonstrate that HMHECs of specific composition can provide gloss emulsion paints with a balance of rheol. properties, combining excellent leveling with sag resistance.

AB Polysaccharide (hydroxyethylcellulose) and synthetic polymers [poly(vinyl alc.)] are modified with alkyl or aralkyl hydrophobic groups; these polymers having mol. weight 10,000-300,000 and 10,000-50,000 (preferred), resp., improve leveling without affecting sag or thickening efficiency. High mol. weight hydrophobically-modified polysaccharide can be degraded with H2O2 to reduce the mol. weight to a useful range.

AB The associative behavior of hydrophobically modified hydroxyethyl cellulose in polymer dispersions was determined as a function of the composition of both the associative thickener (AT) and the latex. How changes in interaction between HMHEC and the latex influence the rheol. of the latex-thickener systems is discussed. Adsorption of HMHECs onto an acrylic emission strongly depends on the hydrophobe type and degree of

substitution, as well as on the mol. weight of the associative thickener. The degree of latex adsorption is influenced dramatically by the stabilization system utilized, i.e., choice and level of surfactant and carboxylic acid content, in addition to the composition of the monomer mix. Rheol. measurements demonstrated that HMHECs of specific composition can provide gloss emulsion paints with a balance of rheol. properties, combining excellent leveling with sag resistance.

AB Particle size distribution (PSD) of polymers prepared from styrene, Me methacrylate, vinyl chloride, diethylaminoethyl methacrylate and Bu methacrylate has a homogeneity of $\geq 60\%$ and weight% latex is ≤ 0.1 weight% [based on weight% monomer(s)] when prepared in presence of a thickener from specified cellulose ethers and $\text{Ca}_3(\text{PO}_4)_2$. Thus, an emulsion polystyrene was prepared in presence of 0.4-0.6 weight% hexadecyl hydroxymethyl cellulose (molar substitution 1.5-4.1) and 0.25 weight% $\text{Ca}_3(\text{PO}_4)_2$ to give homogeneity of PSD 75%.
